DETAILED ACTION

Claims 1-9 are presented in the instant application according to the Applicants' filing on 09/26/2003 and communications filed on 12/30/2003.

Inventorship

1. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Specification

2. The specification is objected to because of lacking brief description of the drawing for Figure 17.

Appropriate correction is required.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1, 6 and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Applicant Admitted Prior Art, Fig. 17.

Art Unit: 2816

With respect to claim 1, Applicant Admitted Prior Art, Fig. 17 discloses a synchronization circuit for receiving an input signal [SIN] and a clock [SCK] having a frequency equal a transfer rate of the input signal, and synchronizing the input signal with the clock, the circuit comprising a) a state detection circuit [6] for outputting a control signal [CTL] according to the temporal relationship between a transition point of the input signal and an edge of the clock; b) a delay selection circuit [4] for adding a delay (*depending on which delay circuit is being selected 1 or 2*) to the input signal on the basis of the control signal; and c) [3] a latch circuit for synchronizing the signal outputted from the delay selection circuit with the clock, and outputting the synchronized signal.

With respect to claim 6, Applicant Admitted Prior Art, Fig. 17 discloses that the delay selection circuit comprises a) a delay circuit [1,2] for adding a delay to the input signal; and b) a selection circuit [4] for selecting either the input signal or the output signal of the delay circuit on the basis of the control signal [CTL].

With respect to claim 9, Applicant Admitted Prior Art, Fig. 17 discloses that the state detection circuit [6] detects the state of the input signal on the basis of a preamble detection signal which supplied from the outside and indicates the positional relationship of data to be synchronized.

Allowable Subject Matter

5. Claims 2-5 and 7-8 are allowed.
6. The following is a statement of reasons for the indication of allowable subject matter:
The closest prior art on record does not show or fairly suggest:

Art Unit: 2816

a) A synchronization circuit including a latch circuit for synchronizing an input signal with a clock outputted from a delay selection circuit, and outputting a synchronized signal, in combination with the remaining claimed limitations, as called for in claim 2;

b) A synchronization circuit including a state detection circuit for outputting control signals relating to respective input signals, according to the temporal relationship between transition points of the plural input signals, in combination with the remaining claimed limitations, as called for in claim 3; and

c) A synchronization circuit including a clock selection circuit for receiving clocks included in respective signal bundles, and selecting one of the inputted clocks, as a synchronization clock, on the basis of the result of a state detection performed between the respective signal bundles by a state detection circuit, in combination with the remaining claimed limitations, as called for in claim 4.

Citation of Relevant Prior Art

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Prior art Takaki et al. (U.S. Patent No. 6,060,929) discloses a signal delay apparatus.

Prior art Oprescu (U.S. Patent No. 6,359,479) discloses synchronizing data transfers between two distinct clock domains.
